

Network Security Reference Architecture

Alex Samonte – Director of Technical Architecture

Network Security Architecture Components

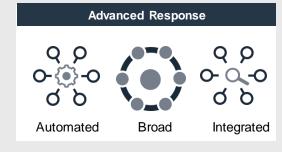

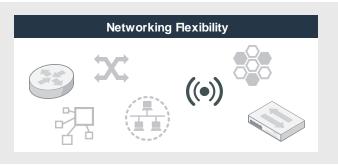

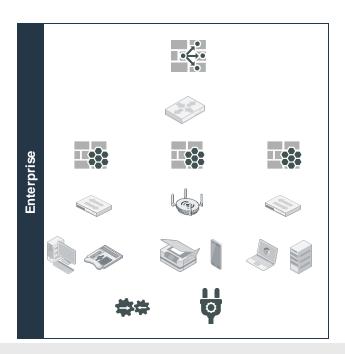

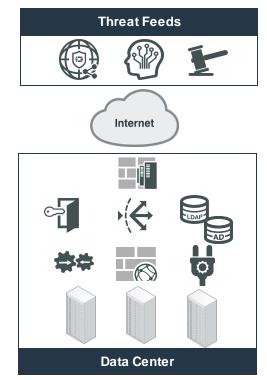

Network Security Critical Capabilities

- · Threat Protection
- Content Visibility
- Identity & Access Management
- · Security Intelligence
- Advanced Response (cusomization, automation)
- Networking Flexibility
- Network & Security Operations & Analytics
- Scalable Multi-Formfactor
- · Open Ecosystem

Network Security Reference Architecture

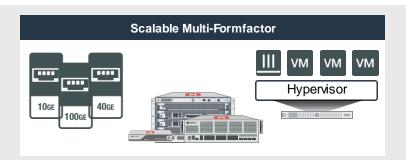

Network Security Critical Capabilities

- Threat Protection
- Content Visibility
- Identity & Access Management
- · Security Intelligence
- Advanced Response (cusomization, automation)
- Networking Flexibility
- Network & Security Operations & Analytics
- · Scalable Multi-Formfactor
- Open Ecosystem

Fortinet Network Security Architecture Components

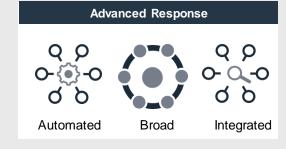

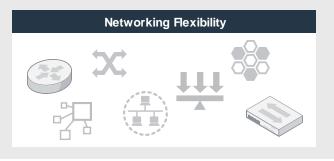

Network Security Critical Capabilities

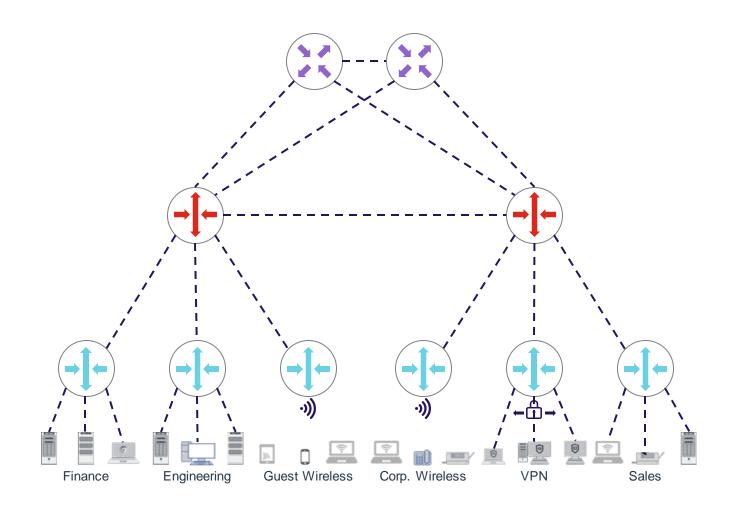

- · Threat Protection
- Content Visibility
- Identity & Access Management
- · Security Intelligence
- Advanced Response (cusomization, automation)

- Networking Flexibility
- Network & Security Operations & Analytics
- · Scalable Multi-Formfactor
- Open Ecosystem

Segmentation Architectures

Use Cases Summary

Segmentation Architectures

Today – Border Security

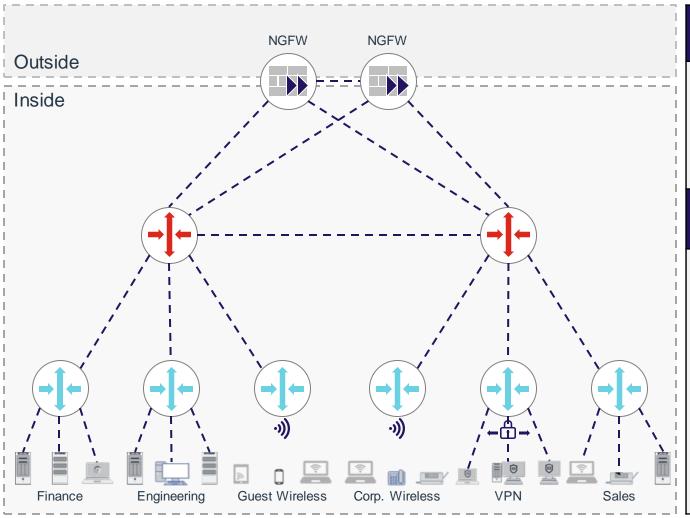

Problem

- Protect business from outside threats
- Protect users from the internet
- Keep users productive

Solution

- Apply all security at the internet edge
- Flat network provides no internal security
- Visibility into the network severely limited
- ❖ Risk of compromise is very high

Establishing Trust

- Network Address
- User Identity
- Business Logic
- Fabric Connectors
- Applications
- Device Identity

- SSL Inspection
- IPS
- Antivirus
- Application Control
- Web Content Filter
- Data Loss Prevention
- Secure Email Gateway
- Denial of Service Protection
- Web Application Firewall
- Cloud Access Security Broker
- Advanced Threat Protection
- Endpoint Protection

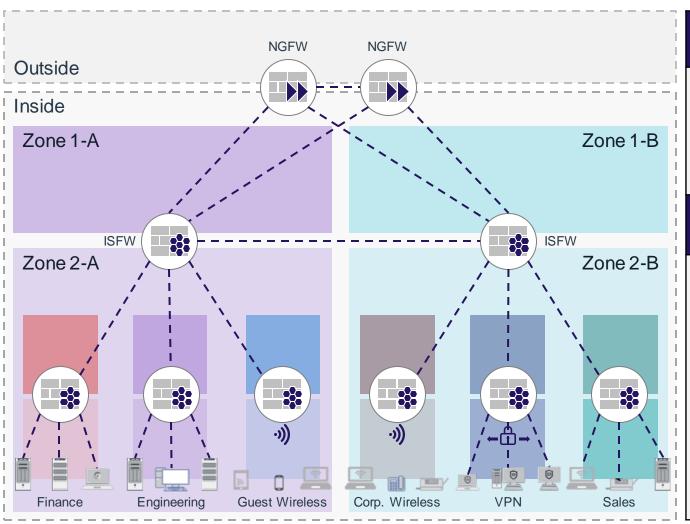

Use Case – Reducing Attack Surface

/ Problem

- Flat internal network
- No internal visibility
- No internal security

Solution

- Many Enforcement points
- Create containment zones
- Inspect SSL
- Inspect Applications
- Check for zero-day malware
- Protect critical assets

Establishing Trust

- Network Address
- User Identity
- Business Logic
- Fabric Connectors
- Applications
- Device Identity

- SSL Inspection
- IPS
- Antivirus
- Application Control
- Web Content Filter
- Data Loss Prevention
- Secure Email Gateway
- Denial of Service Protection
- Web Application Firewall
- Cloud Access Security Broker
- Advanced Threat Protection
- Endpoint Protection

Use Case – Trusted Application Integrity

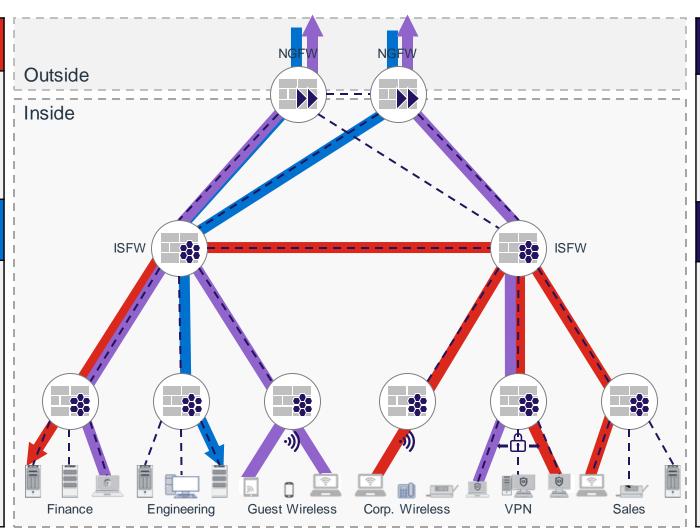

\bigwedge

Problem

- Business critical applications must be secured
- Multiple applications
- Users in many locations

Solution

- Secure applications with solutions that share security intelligence
- Utilize security that will work with mobility and cloud usage
- Inspect SSL to make sure only trusted transactions are taking place
- Establish trust with sources inside and outside the network

Establishing Trust

- Network Address
- User Identity
- Business Logic
- Fabric Connectors
- Applications
- Device Identity

- SSL Inspection
- IPS
- Antivirus
- Application Control
- Web Content Filter
- Data Loss Prevention
- Secure Email Gateway
- Denial of Service Protection
- Web Application Firewall
- Cloud Access Security Broker
- Advanced Threat Protection
- Endpoint Protection

Use Case – Achieving Compliance

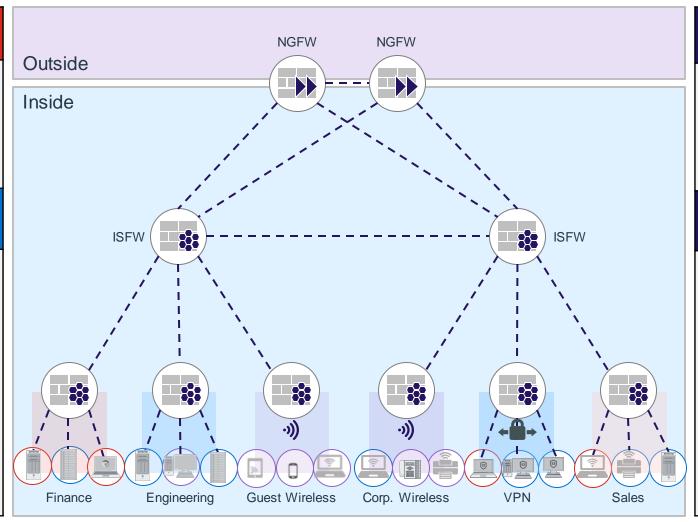

Problem

- Enforcing regulated access
- Does not follow standard network boundaries
- Critical compliance policies

- Multiple enforcement point locations
- Endpoint coverage for specific needs
- Network coverage for IoT
- Visibility for audits
- Keep critical systems running

Establishing Trust

- Network Address
- User Identity
- Business Logic
- Fabric Connectors
- Applications
- Device Identity

- SSL Inspection
- IPS
- Antivirus
- Application Control
- Web Content Filter
- Data Loss Prevention
- Secure Email Gateway
- Denial of Service Protection
- Web Application Firewall
- Cloud Access Security Broker
- Advanced Threat Protection
- Endpoint Protection

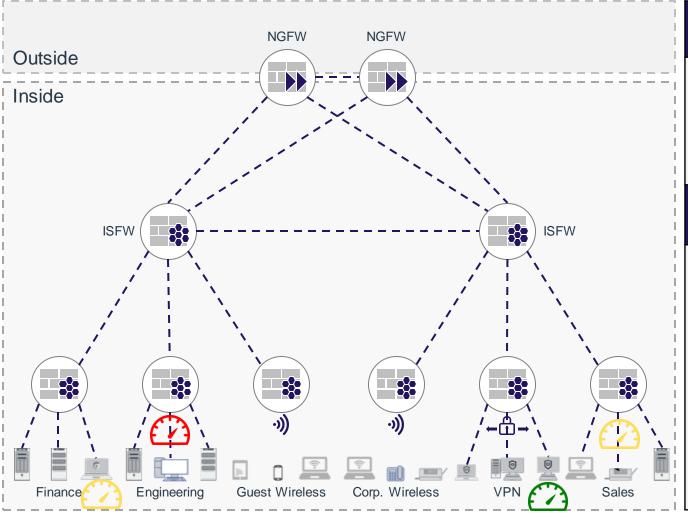

Use Case – Tiered Cloud Access

Problem

- Unexpected cloud costs
- Shadow IT
- No visibility of cloud data

Solution

- Combine cloud usage statistics with local enforcement
- Regulate access to cloud resources from authorized users
- Maintain audit trails of cloud hosted data
- Prevent data exfiltration

Establishing Trust

- Network Address
- User Identity
- Business Logic
- Fabric Connectors
- Applications
- Device Identity

- SSL Inspection
- IPS
- Antivirus
- Application Control
- Web Content Filter
- Data Loss Prevention
- Secure Email Gateway
- Denial of Service Protection
- Web Application Firewall
- Cloud Access Security Broker
- Advanced Threat Protection
- Endpoint Protection

Use Case – Secure Physical Access

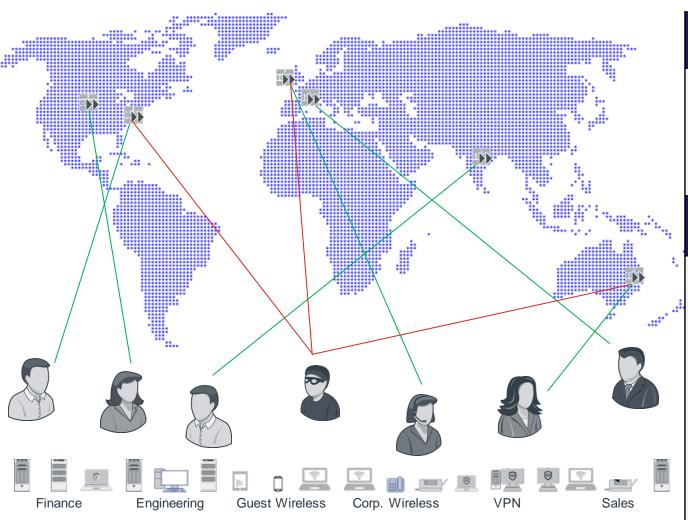

Problem

- Securing global employee presence
- Different systems control different aspects of security

Solution

- Integrate different trust sources
- Correlate physical location token information with network **login location**
- · Maintain identity and device interrelationships
- Prevent targeted attacks

Establishing Trust

- Network Address
- **User Identity**
- Business Logic
- **Fabric Connectors**
- Applications
- Device Identity

- SSL Inspection
- IPS
- Antivirus
- Application Control
- Web Content Filter
- Data Loss Prevention
- Secure Email Gateway
- Denial of Service Protection
- Web Application Firewall
- Cloud Access Security Broker
- **Advanced Threat Protection**
- Endpoint Protection
